

Further Improvements and Notices

Features planned for future

- There is no Appointments feature in the App. Appointments for user Patient is a very crucial part. This feature needs to be implemented via writing a proper RESTful API for communication and a separate Real-Time NoSQL database, hence kept for a future update, hence the ONLY feature mentioned in SRS which is dropped for now for its intricacy.
- Geolocation for clinics, lab. This can be implemented by Google maps API's Paid Tier if App is successful.
- Payment through Built-in Wallet. This requires proper business organization to implement
- Health Checkup reminders: For instance, every 6 months a dental checkup is recommend. If we have a Real Time database, this could be implemented easily

Important Notices

Most probably the default database of the App is working and Up if not, a local server setup is needed for testing, which is tricky and time consuming as described in README.

Please feel free to contact me at maitreygovind@gmail.com or +91 9779063234 if there are any issues in setting up the server.
